

Ribosomal Protein L31 Polyclonal Antibody

RPL31. AA range:61-110 Specificity Ribosomal Protein L31 Polyclonal Antibody detects endogenous levels of Ribosomal Protein L31 protein. Formulation Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide. Source Polyclonal, Rabbit,IgG Purification The antibody was affinity-purified from rabbit antiserum by affinity-chromatography using epitope-specific immunogen. Dilution IHC: 1/100 - 1/300. ELISA: 1/40000 IF 1:50-200 Concentration 1 mg/ml Purity ≥90% Storage Stability -20°C/1 year Synonyms RPL31; 60S ribosome protein L31 Observed Band cytosol, ribosome, focal adhesion, membrane, cytosolic large ribosomal subunit, extracellular exosome, Tissue Specificity Brain, Epithelium, Liver, Prostate, Function similarity:Belongs to the ribosomal protein L31e family., Background Ribosomes, the organelles that catalyze protein synthesis, consist of a small 4 subunit and a large 60S subunit. Together these subunits are composed of 4 R species and approximately 80 structurally distinct proteins. This gene encodes ribosomal protein that is a component of the 60S subunit. The protein belongs ribosomal approtein that is a component of the 60S subunit. The protein belongs ribosomal protein that is a component of the 60S subunit. The protein belongs ribosomal protein that is a component of the 60S subunit. The protein belongs ribosomal protein that is a com		
ReactivityHuman;Mouse;RatApplicationsWB;IHC;IF;ELISAGene NameRPL31Protein Name60S ribosomal protein L31ImmunogenThe antiserum was produced against synthesized peptide derived from human RPL31. The protein belongs the L31E family of ribosomal proteins. It is located in the cytoplasm. Higher level of expression of this gene in familial adenomatous polyps compared to matcher normal tissues have been observed. As is typical for genes encoding ribosomal	Cell Pathway	cytosol,ribosome,focal adhesion,membrane,cytosolic large ribosomal subunit.extracellular exosome.
Background Ribosomes, the organelles that catalyze protein synthesis, consist of a small 4 subunit and a large 60S subunit. Together these subunits are composed of 4 R species and approximately 80 structurally distinct proteins. This gene encodes ribosomal protein that is a component of the 60S subunit. The protein belongs the L31E family of ribosomal proteins. It is located in the cytoplasm. Higher level of expression of this gene in familial adenomatous polyps compared to matche normal tissues have been observed. As is typical for genes encoding ribosomal	Tissue Specificity	
subunit and a large 60S subunit. Together these subunits are composed of 4 R species and approximately 80 structurally distinct proteins. This gene encodes ribosomal protein that is a component of the 60S subunit. The protein belongs the L31E family of ribosomal proteins. It is located in the cytoplasm. Higher leve of expression of this gene in familial adenomatous polyps compared to matche normal tissues have been observed. As is typical for genes encoding ribosoma	Function	similarity:Belongs to the ribosomal protein L31e family.,
	Background	Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a large 60S subunit. Together these subunits are composed of 4 RNA species and approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is a component of the 60S subunit. The protein belongs to the L31E family of ribosomal proteins. It is located in the cytoplasm. Higher levels of expression of this gene in familial adenomatous polyps compared to matched normal tissues have been observed. As is typical for genes encoding ribosomal proteins, there are multiple processed pseudogenes of this gene dispersed
