<b>Function</b>	domain:The acidic domains are probably involved in the interaction with histones.,function:May be involved in modulating chromatin formation and contribute to regulation of cell proliferation.,similarity:Belongs to the nucleosome assembly protein (NAP) family.,subcellular location:Identified by mass spectrometry in melanosome fractions from stage I to stage IV.,tissue specificity:Ubiquitously expressed.,
<b>Background</b>	This gene encodes a member of the nucleosome assembly protein (NAP) family. This protein participates in DNA replication and may play a role in modulating chromatin formation and contribute to the regulation of cell proliferation. Alternative splicing results in multiple transcript variants encoding different isoforms; however, not all have been fully described. [provided by RefSeq, Apr
