Function	caution:Was originally (PubMed:3419518) thought to be a receptor for angiotensin II.,disease:The MAS oncogene has a weak focus-inducing activity in transfected NIH 3T3 cells.,similarity:Belongs to the G-protein coupled receptor 1 family.,
Background	This gene encodes a class I seven-transmembrane G-protein-coupled receptor. The encoded protein is a receptor for angiotensin-(1-7) and preferentially couples to the Gq protein, activating the phospholipase C signaling pathway. The encoded protein may play a role in multiple processes including hypotension, smooth muscle relaxation and cardioprotection by mediating the effects of angiotensin-(1-7).
