Cell Pathway Cytoplasm, cytoskeleton.	
Tissue Specificity Widely expressed.	
Function catalytic activity:ATP + a [protein]-L-tyrosine = ADP + a [protein]-L phosphate.,caution:The sequence shown here is derived from an automatic analysis pipeline and should be considered as prelimina data.,cofactor:Magnesium or manganese.,enzyme regulation:Stab inactive form by an association between the SH3 domain and the region, interactions of the amino-terminal cap, and contributions fro amino-terminal myristoyl group and phospholipids. Activated by autophosphorylation as well as by SRC-family kinase-mediated ph Activated by RIN1 binding to the SH2 and SH3 domains. Inhibited	Ensembl ry ilized in the SH2-TK linker om an osphorylation.

	mesylate (Gleevec) which is used for the treatment of chronic myeloid leukemia (CML).,function:Regulates cytoskeleton remodeling during cell differentiation, cell division and cell adhesion. Localizes to dynamic actin structures, and phosph
Background	This gene encodes a member of the Abelson family of nonreceptor tyrosine protein kinases. The protein is highly similar to the c-abl oncogene 1 protein, including the tyrosine kinase, SH2 and SH3 domains, and it plays a role in cytoskeletal rearrangements through its C-terminal F-actin- and microtubule-binding sequences. This gene is expressed in both normal and tumor cells, and is involved in translocation with the ets variant 6 gene in leukemia. Multiple alternatively spliced transcript variants encoding different protein isoforms have been found for this gene. [provided by RefSeq, Nov 2009],
matters needing attention	Avoid repeated freezing and thawing!
Usage suggestions	This product can be used in immunological reaction related experiments. For more information, please consult technical personnel.
