Generally nucleolar, but is translocated to the nucleoplasm in case of serum starvation or treatment with anticancer drugs. Has been found in the cytoplasm in patients with primary acute myelogenous leukemia (AML), but not with secondary AML. Can shuttle between cytoplasm and nucleus. Co- localizes with the methylated form of RPS10 in the granular component (GC) region of the nucleolus. Colocalized with nucleolin and APEX1 in nucleoli. ukemia. Translocation t(5;17)(q32;q11) with RARA.,disease:A chromosomal perration involving NPM1 is found in a form of non-Hodgkin lymphoma. Translocation t(2;5)(p23;q35) with ALK. The resulting chimeric NPM1-ALK protein prodimerize and the kinase becomes constitutively activated.,disease:Defects NPM1 are associated with acute myelogenous leukemia (AML). Mutations in king affecting the C-terminus of the protein are associated with an aberrant proposition location.,function:Involved in diverse cellular processes such as posome biogenesis, centrosome duplication, protein chaperoning, histonessembly, cell proliferation, and regulation of tumor suppressor
acleophosmin(NPM1) Homo sapiens This gene encodes a nosphoprotein which moves between the nucleus and the cytoplasm. The gene oduct is thought to be involved in several processes including regulation of the RF/p53 pathway. A number of genes are fusion partners have been naracterized, in particular the anaplastic lymphoma kinase gene on chromosome Mutations in this gene are associated with acute myeloid leukemia. More than a ozen pseudogenes of this gene have been identified. Alternative splicing results multiple transcript variants.[provided by RefSeq, Nov 2009],
